

## ***Get a file server (network storage) to solve all your data problems***

### **Central repository for all data**

Keep all the documents on the file server and access the server from any computer. No matter which computer you are using at the office, you have full access to the same documents. No confusion anymore between multiple copies of the same files saved on different computers.

### **Share documents and files locally**

This allows you to grant access to files to multiple people at the same time. The file server allows you to save any kind of files including, documents, music, photos, and videos and share them with anyone in the office.

### **Access over the Internet**

Access your files anywhere in the world. This allows you to visit client's locations without having to carry data with you. You are home and want to access your documents that are on the office computers? No problem, this solution gives you full access to your documents anywhere in the world.

### **Redundancy**

A company's data is one of its most important assets. Hard drives often fail resulting in loss of vital data. With this solution you never lose any data. The server manages this by mirroring the data over two separate hard drives. So even if a hard drive fails your data stays intact.

### **FTP Server**

This includes an FTP server which allows your clients and contractors to upload and download large files in a safe and secure fashion anywhere in the world. No need to worry about emailing large files anymore.

For only \$499.00 + TAX (one time setup includes a server and 2 hard drives).
